

U.S.S.N. 08/823,999  
Filed: March 25, 1997  
AMENDMENT

**Substitute Abstract**

Please replace the abstract of the application with the following paragraph.

-- Compounds that specifically inhibit or reduce leukocyte adhesion or function are useful to enhance vascular healing and lessen restenosis of blood vessels after revascularization, via angioplasty or bypass surgery, of diseased coronary, peripheral and cerebral arteries, and lessen stenosis or restenosis of surgically-placed bypass grafts and transplanted organs. Examples of these compounds are those which block cell surface integrins, such as Mac-1 (CD11b/CD18, M2) or their ligands. Both superficial and deep injury was significantly reduced with treatment using an antibody to Mac-1 compared to both saline controls and IgG controls in the examples. After balloon angioplasty (superficial injury) neointimal area was reduced nearly 70%. The ratio of intimal:medial area was reduced over 75%. After endovascular stent implantation (deep injury) neointimal area was reduced nearly 40%. Extrapolated to humans, this reduction in the intimal thickening would reduce occurrence of restenosis from approximately 30% of patients to less than 10%.—
